# Continuous, closed-loop compliance at scale

Security and IT operations teams must work together to keep data centers secure and compliant, but efforts are often hampered by disparate toolsets, misaligned workflows, and competing priorities. It's time for change.

SaltStack® Comply harnesses SaltStack event-driven automation to deliver full-service, closed-loop automation for IT security and compliance. With SaltStack Comply, security and operations teams can work together to define a corporate security policy, scan all systems against it, detect issues, and actively remediate them—all from a single platform.
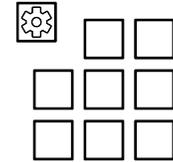

Define

Build a policy with CIS-certified compliance content and apply it automatically across your digital footprint.
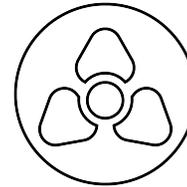

Detect

Run continuous, item-level policy checks to locate non-compliant systems or applications anywhere in your environment.

Enforce

Use autonomous policy enforcement to fix violations instantly. Or kick off a remediation workflow to flag and prioritize issue resolution.

> "We've seen a 75% reduction in the work simply needed to coordinate priorities between our security and IT operations teams. SaltStack SecOps is the catalyst to help IBM Cloud achieve the goal of continuous compliance while optimizing collaboration and output between our global security, IT, and governance teams."

Stephen Dumesnil | **IBM Cloud Network Engineering Governance Manager**

IBM Cloud

Access a live, hosted library of compliance profiles

SaltStack SecOps includes access to a live, growing repository of standard compliance profiles for major Linux operating systems across cloud, on-prem and containerized environments today, with growing support for Windows and Unix operating systems continually added. Every profile includes hundreds of up-to-date issue scans, detailed descriptions, and the automated remediation actions for each check.

CIS Certified content for:
- RHEL 6, 7
- Centos 6, 7
- Debian 9
- Ubuntu 16.04, 18.04
- New content added weekly

Reference mapping to:
- National Institute of Standards and Technology (NIST)
- Industry specific profiles, such as PCI and HIPAA

Customize policies and remediate

SaltStack Comply offers complete policy customization. Create your own company-specific checks, turn off pre-built checks that don't apply, or create exemptions and rules for specific machines as needed. Then use SaltStack event-driven automation to detect policy violations anywhere in your infrastructure and automatically remediate issues.
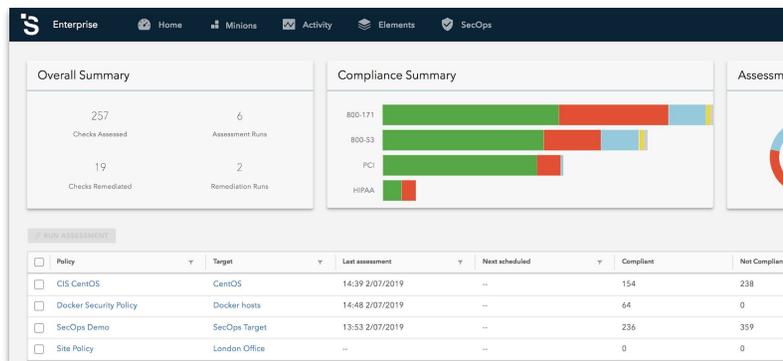

Part of the SaltStack SecOps Suite

SaltStack Comply is one of the powerful products available as part of the SaltStack SecOps product suite, designed to help IT operations and security teams use event-driven automation to detect compliance and security risks and automatically remediate them. SaltStack also offers powerful integrations, IT system control, and much more.
